

EXPERIENCE

Hazlo Ya - Senior Full-Stack Engineer, Oct 2025 - Apr 2026

Built a multi-tenant B2B service marketplace and accounting app from scratch. Clients compare quotes, check ratings, and award work in-app, while the platform's unified e-invoicing engine sets the national billing standard.

AI Invoice Scanner - Apr 2026

Created a web app to transform invoices into structured data using ollama. Turning pdfs/images into a queryable Postgres database. The app works with private inference because the LLM runs on a local machine, which is exposed to the internet using a Cloudflare Tunnel + Zero Trust Access.

Gaias Labs - Senior Full-Stack Engineer, Mar 2024 - Oct 2025

Created a web video game with thousands of players with a pioneered solution to synchronize the blockchain with a MySQL database. The players' stats and global leaderboards were updated in near real time. It also introduced an innovative way to execute complex financial transactions with a simple UI.

Backend contributions

- Created a referral system with which tens of thousands of users were referred.
- Created a MySQL database with 57 tables using Drizzle ORM and deployed it to Planetscale.
- Detected a critical security vulnerability with Privy authentication in our frontend and patched it.
- Created 88 endpoints to handle financial transactions, serve user data, authenticate, perform user and admin actions, handle webhooks from third party services, and handle cron jobs.
- Deployed a Linux server (Ubuntu) on DigitalOcean to manage Node.js workers and cron jobs.
- Implemented parallel UserOps to execute financial transactions concurrently.
- Created a job queue with BullMQ and Redis to update the players' data in real time.
- Created strongly typed tRPC endpoints that significantly reduced development time by providing thorough errors and automatically documenting all endpoints through type inference.
- Created a token-based reward mechanism which aggregated user data weekly to determine reward size.
- Created in-app currency exchange.

Management contributions

- Conducted interviews to hire a frontend engineer and tutored two frontend engineers (Next.js, Typescript).
- Provided design and engineering patterns, including the use of TailwindCSS and shadcn-ui to ensure a smooth development between all team members.

Frontend contributions

- Made the app installable as a PWA and compatible with Farcaster, Base, and Telegram Mini Apps.

Uneven Labs, Cocoa, FL - Frontend Engineer, Oct. 2021 - Oct. 2022

- Created the Reservoir Market, an open source NFT marketplace with 250+ forks.
- Contributed to ReservoirKit, a React package that makes it easy to add buying NFTs into a dApp.
- Created the Reservoir Client SDK package. It contains functions to interact with the Reservoir Router API.
- Provided technical support to developers who use the Reservoir Market.
- Served as an assistant to a Solidity engineer.

EDUCATION

NJIT, Newark, NJ - Bachelor's Degree in Electrical Engineering (Computer Systems), 2019

- Created finite state machines and implemented the MIPS RISC architecture in FPGAs using VHDL.
- Programmed microprocessors using C and Assembly language.
